

ABSTRACT OF THE DISCLOSURE

The spray head of the spray head assembly of the pre-rinse assembly has five different positions to deliver five different types of water patterns. The spray head has internal ports that communicate with openings that have spouts or an aperture plate to deliver a full stream, a jet stream or a mist. In addition, the spray head has ports that communicate with two separate internal chambers that, in turn, communicate with a pair of concentric rings of openings to deliver a center spray pattern or a shower spray pattern of water. The spray head can be used to wash or rinse utensils that need cleaning, to scour adhered food particles from utensils using a jet spray, and to apply a mist or shower pattern to foods that need refreshing or cleaning.
